Complexity Theory

Exercise 9: Alternation

9 January 2018

Exercise 9.1. Describe a polynomial-time ATM solving **EXACT INDEPENDENT SET**:

Input: Given a graph G and some number k.
Question: Does there exists a maximal independent set in G of size exactly k?

Find a level of the polynomial hierarchy where this problem is contained in.

Exercise 9.2. Consider the Japanese game *go-moku* that is played by two players X and O on a 19x19 board. Players alternately place markers on the board, and the first one to have five of its markers in a row, column, or diagonal wins.

Consider the generalised version of go-moku on an $n \times n$ board. Say that a *position* of go-moku is a placement of markers on such a board as it could occur during the game. Define

$$\textbf{GM} = \{\langle B \rangle \mid B \text{ is a position of go-moku where X has a winning strategy}\}.$$

Describe a polynomial-time ATM solving **GM**.

Exercise 9.3. Show that $\mathrm{AExpTime} = \mathrm{ExpSpace}$.

Exercise 9.4. Show the following result: *If there is any k such that $\Sigma_k^{\mathrm{P}} = \Sigma_{k+1}^{\mathrm{P}}$ then $\Sigma_j^{\mathrm{P}} = \Pi_j^{\mathrm{P}} = \Sigma_k^{\mathrm{P}}$ for all $j > k$, and therefore $\mathrm{PH} = \Sigma_k^{\mathrm{P}}$.*

Exercise 9.5. Show that $\mathrm{PH} \subseteq \mathrm{PSpace}$.
