Complexity Theory

Exercise 7: Alternation

9 Dec 2025

Exercise 7.1. Describe a polynomial-time ATM solving **EXACT INDEPENDENT SET**:

Input: Given a graph G and some number k.
Question: Does there exists a maximal independent set in G of size exactly k?

Find a level of the polynomial hierarchy where this problem is contained in.

Exercise 7.2. Consider the Japanese game *go-moku* that is played by two players X and O on a 19x19 board. Players alternately place markers on the board, and the first one to have five of its markers in a row, column, or diagonal wins.

Consider the generalised version of go-moku on an $n \times n$ board. Say that a *position* of go-moku is a placement of markers on such a board as it could occur during the game. Define

$$\textbf{GM} = \{\langle B \rangle \mid B \text{ is a position of go-moku where } \mathsf{X} \text{ has a winning strategy}\}.$$

Describe a polynomial-time ATM solving **GM** and informally argue why this problem is not in any level of the polynomial hierarchy.

Exercise 7.3. Show that $\mathrm{AExpTime} = \mathrm{ExpSpace}$.

Exercise 7.4. Show that $\Sigma_2\mathsf{QBF}$ is complete for $\Sigma_2\mathsf{P}$.

Exercise 7.5. Show that if $\mathsf{P} = \mathsf{NP}$, then $\mathsf{P} = \mathsf{PH}$.
