Description Logics – Syntax and Semantics I

Lecture 4, 30th Oct 2023 // Foundations of Knowledge Representation, WS 2023/24

Motivation

Motivation

Many KR applications do not require full power of FOL

What can we leave out?

- Key reasoning problems should become **decidable**
- Sufficient expressive power to model application domain

Description Logics are a family of FOL fragments that meet these requirements for many applications:

- Underlying formalisms of modern **ontology languages**
- Widely used in bio-medical information systems
- Core component of the **Semantic Web**

Motivation

Recall our arthritis example:

- A juvenile disease affects only children or teenagers
- Children and teenagers are not adults
- A person is either a child, a teenager, or an adult
- Juvenile arthritis is a kind of arthritis and a juvenile disease
- Every kind of arthritis damages some joint

The important types of objects are given by unary FOL predicates:
juvenile disease, child, teenager, adult, ...

The types of relationships are given by binary FOL predicates:
affects, damages, ...

Motivation

The vocabulary of a Description Logic is composed of

- Unary FOL predicates

Arthritis, Child, ...

- Binary FOL predicates

Affects, Damages, ...

- FOL constants

JohnSmith, MaryJones, JRA, ...

We are already restricting the expressive power of FOL

- No function symbols (of positive arity)
- No predicates of arity greater than 2

Motivation

Let us take a closer look at the FOL formulas for our example:

$$\forall x.(\text{JuvDis}(x) \rightarrow \forall y.(\text{Affects}(x, y) \rightarrow \text{Child}(y) \vee \text{Teen}(y)))$$

$$\forall x.(\text{Child}(x) \vee \text{Teen}(x) \rightarrow \neg \text{Adult}(x))$$

$$\forall x.(\text{Person}(x) \rightarrow \text{Child}(x) \vee \text{Teen}(x) \vee \text{Adult}(x))$$

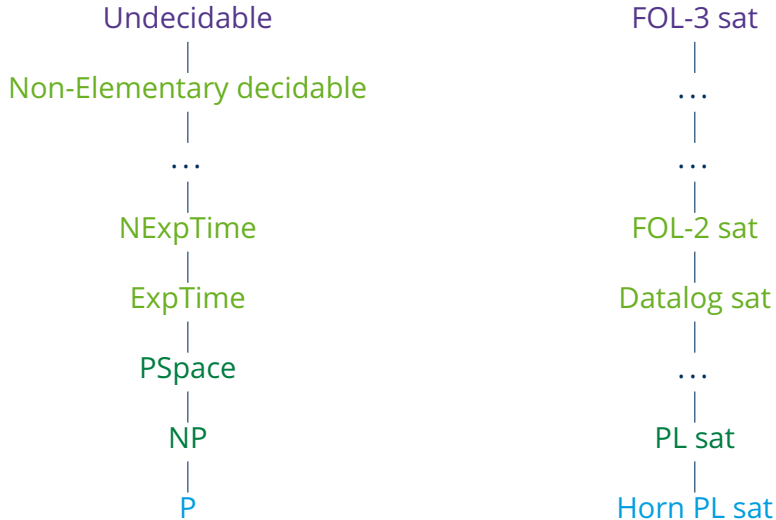

$$\forall x.(\text{JuvArthritis}(x) \rightarrow \text{Arthritis}(x) \wedge \text{JuvDis}(x))$$

$$\forall x.(\text{Arthritis}(x) \rightarrow \exists y.(\text{Damages}(x, y) \wedge \text{Joint}(y)))$$

We can find several **regularities** in these formulas:

- There is an outermost universal quantifier on a single variable x
- The formulas can be split into two parts by the implication symbol
Each part is a formula with one free variable
- Atomic formulas involving a binary predicate occur only quantified in a syntactically restricted way.

Complexity

Motivation

Consider as an example one of our formulas:

$$\forall x.(\textit{Child}(x) \vee \textit{Teen}(x) \rightarrow \neg \textit{Adult}(x))$$

Let us look at all its sub-formulas at each side of the implication

Child(x) Set of all children

Teen(x) Set of all teenagers

Child(x) \vee *Teen*(x) Set of all objects that are children or teenagers

Adult(x) Set of all adults

$\neg \textit{Adult}$ (x) Set of all objects that are not adults

Important observations concerning formulas with one free variable:

- Some are **atomic** (e.g., *Child*(x))
do not contain other formulas as subformulas
- Others are **complex** (e.g., *Child*(x) \vee *Teen*(x))

Basic Definitions

Idea: Define **operators** for constructing complex formulas with one free variable out of simple **building blocks**

Atomic Concept: Represents an atomic formula with one free variable

$$\textit{Child} \rightsquigarrow \textit{Child}(x)$$

Complex concepts (part 1):

- Concept Union (\sqcup): applies to two concepts

$$\textit{Child} \sqcup \textit{Teen} \rightsquigarrow \textit{Child}(x) \vee \textit{Teen}(x)$$

- Concept Intersection (\sqcap): applies to two concepts

$$\textit{Arthritis} \sqcap \textit{JuvDis} \rightsquigarrow \textit{Arthritis}(x) \wedge \textit{JuvDis}(x)$$

- Concept Negation (\neg): applies to one concept

$$\neg \textit{Adult} \rightsquigarrow \neg \textit{Adult}(x)$$

Motivation

Consider examples with binary predicates:

$$\forall x.(\text{Arthritis}(x) \rightarrow \exists y.(\text{Damages}(x,y) \wedge \text{Joint}(y)))$$
$$\forall x.(\text{JuvDis}(x) \rightarrow \forall y.(\text{Affects}(x,y) \rightarrow \text{Child}(y) \vee \text{Teen}(y)))$$

- We have a **concept** and a binary predicate (called a **role**) mentioning the concept's free variable
- The role and the concept are connected via conjunction (existential quantification) or implication (universal quantification)
- Nested sub-concepts use a fresh (existentially/universally quantified) variable, and are connected to the surrounding concept by exactly one role atom (often called a **guard**)

Basic Definitions

Atomic Role: Represents an atom with two free variables

$$\textit{Affects} \rightsquigarrow \textit{Affects}(x,y)$$

Complex concepts (part 2): apply to an atomic role and a concept

- Existential Restriction:

$$\exists \textit{Damages.Joint} \rightsquigarrow \exists y.(\textit{Damages}(x,y) \wedge \textit{Joint}(y))$$

- Universal Restriction:

$$\forall \textit{Affects}.(\textit{Child} \sqcup \textit{Teen}) \rightsquigarrow \forall y.(\textit{Affects}(x,y) \rightarrow \textit{Child}(y) \vee \textit{Teen}(y))$$

ALC Concepts

ALC is the basic description logic

ALC concepts are inductively defined from atomic concepts and roles:

- Every atomic concept is a concept
- \top and \perp are concepts
- If C is a concept, then $\neg C$ is a concept
- If C and D are concepts, then so are $C \sqcap D$ and $C \sqcup D$
- If C a concept and R a role, $\forall R.C$ and $\exists R.C$ are concepts.

Concepts describe sets of objects with certain common features:

$Woman \sqcap \exists hasChild.(\exists hasChild.Person)$	Women with a grandchild
$Disease \sqcap \forall Affects.Child$	Diseases affecting only children
$Person \sqcap \neg \exists owns.DetHouse$	People not owning a detached house
$Man \sqcap \exists hasChild.\top \sqcap \forall hasChild.Man$	Fathers having only sons

↪ Very useful idea for Knowledge Representation

General Concept Inclusion Axioms

Recall our example formulas:

$$\forall x.(\text{JuvDis}(x) \rightarrow \forall y.(\text{Affects}(x,y) \rightarrow \text{Child}(y) \vee \text{Teen}(y)))$$

$$\forall x.(\text{Child}(x) \vee \text{Teen}(x) \rightarrow \neg \text{Adult}(x))$$

$$\forall x.(\text{Person}(x) \rightarrow \text{Child}(x) \vee \text{Teen}(x) \vee \text{Adult}(x))$$

$$\forall x.(\text{JuvArthritis}(x) \rightarrow \text{Arthritis}(x) \wedge \text{JuvDis}(x))$$

$$\forall x.(\text{Arthritis}(x) \rightarrow \exists y.(\text{Damages}(x,y) \wedge \text{Joint}(y)))$$

They are of the following form, with $\alpha_C(x)$ and $\alpha_D(x)$ corresponding to \mathcal{ALC} concepts C and D

$$\forall x.(\alpha_C(x) \rightarrow \alpha_D(x))$$

Such sentences are \mathcal{ALC} General Concept Inclusion Axioms (GCIs)

$$C \sqsubseteq D$$

where C and D are \mathcal{ALC} -concepts

General Concept Inclusion Axioms

$\forall x.(\text{JuvDis}(x) \rightarrow$

$\forall y.(\text{Affects}(x, y) \rightarrow \text{Child}(y) \vee \text{Teen}(y))) \rightsquigarrow$

$\forall x.(\text{Child}(x) \vee \text{Teen}(x) \rightarrow \neg \text{Adult}(x)) \rightsquigarrow$

$\forall x.(\text{Person}(x) \rightarrow \text{Child}(x) \vee \text{Teen}(x) \vee \text{Adult}(x)) \rightsquigarrow$

$\forall x.(\text{JuvArth}(x) \rightarrow \text{Arth}(x) \wedge \text{JuvDis}(x)) \rightsquigarrow$

$\forall x.(\text{Arth}(x) \rightarrow \exists y.(\text{Damages}(x, y) \wedge \text{Joint}(y))) \rightsquigarrow$

Note that we often use $C \equiv D$ as an abbreviation for a symmetrical pair of GCIs $C \sqsubseteq D$ and $D \sqsubseteq C$, e.g.:

$$\left. \begin{array}{l} \text{Arth} \sqcap \text{JuvDis} \sqsubseteq \text{JuvArth} \\ \text{JuvArth} \sqsubseteq \text{Arth} \sqcap \text{JuvDis} \end{array} \right\} \rightsquigarrow \text{JuvArth} \equiv \text{Arth} \sqcap \text{JuvDis}$$

General Concept Inclusion Axioms

$\forall x.(\text{JuvDis}(x) \rightarrow$

$\forall y.(\text{Affects}(x, y) \rightarrow \text{Child}(y) \vee \text{Teen}(y))) \rightsquigarrow \text{JuvDis} \sqsubseteq \forall \text{Affects}.(\text{Child} \sqcup \text{Teen})$

$\forall x.(\text{Child}(x) \vee \text{Teen}(x) \rightarrow \neg \text{Adult}(x)) \rightsquigarrow$

$\forall x.(\text{Person}(x) \rightarrow \text{Child}(x) \vee \text{Teen}(x) \vee \text{Adult}(x)) \rightsquigarrow$

$\forall x.(\text{JuvArth}(x) \rightarrow \text{Arth}(x) \wedge \text{JuvDis}(x)) \rightsquigarrow$

$\forall x.(\text{Arth}(x) \rightarrow \exists y.(\text{Damages}(x, y) \wedge \text{Joint}(y))) \rightsquigarrow$

Note that we often use $C \equiv D$ as an abbreviation for a symmetrical pair of GCI's $C \sqsubseteq D$ and $D \sqsubseteq C$, e.g.:

$$\left. \begin{array}{l} \text{Arth} \sqcap \text{JuvDis} \sqsubseteq \text{JuvArth} \\ \text{JuvArth} \sqsubseteq \text{Arth} \sqcap \text{JuvDis} \end{array} \right\} \rightsquigarrow \text{JuvArth} \equiv \text{Arth} \sqcap \text{JuvDis}$$

General Concept Inclusion Axioms

$\forall x.(\text{JuvDis}(x) \rightarrow$

$\forall y.(\text{Affects}(x, y) \rightarrow \text{Child}(y) \vee \text{Teen}(y))) \rightsquigarrow \text{JuvDis} \sqsubseteq \forall \text{Affects}.(\text{Child} \sqcup \text{Teen})$

$\forall x.(\text{Child}(x) \vee \text{Teen}(x) \rightarrow \neg \text{Adult}(x)) \rightsquigarrow \text{Child} \sqcup \text{Teen} \sqsubseteq \neg \text{Adult}$

$\forall x.(\text{Person}(x) \rightarrow \text{Child}(x) \vee \text{Teen}(x) \vee \text{Adult}(x)) \rightsquigarrow$

$\forall x.(\text{JuvArth}(x) \rightarrow \text{Arth}(x) \wedge \text{JuvDis}(x)) \rightsquigarrow$

$\forall x.(\text{Arth}(x) \rightarrow \exists y.(\text{Damages}(x, y) \wedge \text{Joint}(y))) \rightsquigarrow$

Note that we often use $C \equiv D$ as an abbreviation for a symmetrical pair of GCIs $C \sqsubseteq D$ and $D \sqsubseteq C$, e.g.:

$$\left. \begin{array}{l} \text{Arth} \sqcap \text{JuvDis} \sqsubseteq \text{JuvArth} \\ \text{JuvArth} \sqsubseteq \text{Arth} \sqcap \text{JuvDis} \end{array} \right\} \rightsquigarrow \text{JuvArth} \equiv \text{Arth} \sqcap \text{JuvDis}$$

General Concept Inclusion Axioms

$\forall x.(\text{JuvDis}(x) \rightarrow$

$\forall y.(\text{Affects}(x, y) \rightarrow \text{Child}(y) \vee \text{Teen}(y))) \rightsquigarrow \text{JuvDis} \sqsubseteq \forall \text{Affects}.(\text{Child} \sqcup \text{Teen})$

$\forall x.(\text{Child}(x) \vee \text{Teen}(x) \rightarrow \neg \text{Adult}(x)) \rightsquigarrow \text{Child} \sqcup \text{Teen} \sqsubseteq \neg \text{Adult}$

$\forall x.(\text{Person}(x) \rightarrow \text{Child}(x) \vee \text{Teen}(x) \vee \text{Adult}(x)) \rightsquigarrow \text{Person} \sqsubseteq \text{Child} \sqcup \text{Teen} \sqcup \text{Adult}$

$\forall x.(\text{JuvArth}(x) \rightarrow \text{Arth}(x) \wedge \text{JuvDis}(x)) \rightsquigarrow$

$\forall x.(\text{Arth}(x) \rightarrow \exists y.(\text{Damages}(x, y) \wedge \text{Joint}(y))) \rightsquigarrow$

Note that we often use $C \equiv D$ as an abbreviation for a symmetrical pair of GCIs $C \sqsubseteq D$ and $D \sqsubseteq C$, e.g.:

$$\left. \begin{array}{l} \text{Arth} \sqcap \text{JuvDis} \sqsubseteq \text{JuvArth} \\ \text{JuvArth} \sqsubseteq \text{Arth} \sqcap \text{JuvDis} \end{array} \right\} \rightsquigarrow \text{JuvArth} \equiv \text{Arth} \sqcap \text{JuvDis}$$

General Concept Inclusion Axioms

$\forall x.(\text{JuvDis}(x) \rightarrow$

$\forall y.(\text{Affects}(x, y) \rightarrow \text{Child}(y) \vee \text{Teen}(y))) \rightsquigarrow \text{JuvDis} \sqsubseteq \forall \text{Affects}.(\text{Child} \sqcup \text{Teen})$

$\forall x.(\text{Child}(x) \vee \text{Teen}(x) \rightarrow \neg \text{Adult}(x)) \rightsquigarrow \text{Child} \sqcup \text{Teen} \sqsubseteq \neg \text{Adult}$

$\forall x.(\text{Person}(x) \rightarrow \text{Child}(x) \vee \text{Teen}(x) \vee \text{Adult}(x)) \rightsquigarrow \text{Person} \sqsubseteq \text{Child} \sqcup \text{Teen} \sqcup \text{Adult}$

$\forall x.(\text{JuvArth}(x) \rightarrow \text{Arth}(x) \wedge \text{JuvDis}(x)) \rightsquigarrow \text{JuvArth} \sqsubseteq \text{Arth} \sqcap \text{JuvDis}$

$\forall x.(\text{Arth}(x) \rightarrow \exists y.(\text{Damages}(x, y) \wedge \text{Joint}(y))) \rightsquigarrow$

Note that we often use $C \equiv D$ as an abbreviation for a symmetrical pair of GCIs $C \sqsubseteq D$ and $D \sqsubseteq C$, e.g.:

$$\left. \begin{array}{l} \text{Arth} \sqcap \text{JuvDis} \sqsubseteq \text{JuvArth} \\ \text{JuvArth} \sqsubseteq \text{Arth} \sqcap \text{JuvDis} \end{array} \right\} \rightsquigarrow \text{JuvArth} \equiv \text{Arth} \sqcap \text{JuvDis}$$

General Concept Inclusion Axioms

$\forall x.(JuvDis(x) \rightarrow$

$\forall y.(Affects(x,y) \rightarrow Child(y) \vee Teen(y))) \rightsquigarrow JuvDis \sqsubseteq \forall Affects.(Child \sqcup Teen)$

$\forall x.(Child(x) \vee Teen(x) \rightarrow \neg Adult(x)) \rightsquigarrow Child \sqcup Teen \sqsubseteq \neg Adult$

$\forall x.(Person(x) \rightarrow Child(x) \vee Teen(x) \vee Adult(x)) \rightsquigarrow Person \sqsubseteq Child \sqcup Teen \sqcup Adult$

$\forall x.(JuvArth(x) \rightarrow Arth(x) \wedge JuvDis(x)) \rightsquigarrow JuvArth \sqsubseteq Arth \sqcap JuvDis$

$\forall x.(Arth(x) \rightarrow \exists y.(Damages(x,y) \wedge Joint(y))) \rightsquigarrow Arth \sqsubseteq \exists Damages.Joint$

Note that we often use $C \equiv D$ as an abbreviation for a symmetrical pair of GCIs $C \sqsubseteq D$ and $D \sqsubseteq C$, e.g.:

$$\left. \begin{array}{l} Arth \sqcap JuvDis \sqsubseteq JuvArth \\ JuvArth \sqsubseteq Arth \sqcap JuvDis \end{array} \right\} \rightsquigarrow JuvArth \equiv Arth \sqcap JuvDis$$

Terminological Statements

GCI's allow us to represent a surprising variety of terminological statements:

- Sub-type statements

$$\forall x.(JuvArth(x) \rightarrow Arth(x)) \rightsquigarrow JuvArth \sqsubseteq Arth$$

- Full definitions:

$$\forall x.(JuvArth(x) \leftrightarrow Arth(x) \wedge JuvDis(x)) \rightsquigarrow JuvArth \equiv Arth \sqcap JuvDis$$

- Disjointness statements:

$$\forall x.(Child(x) \rightarrow \neg Adult(x)) \rightsquigarrow Child \sqsubseteq \neg Adult$$

- Covering statements:

$$\forall x.(Person(x) \rightarrow Adult(x) \vee Child(x)) \rightsquigarrow Person \sqsubseteq Adult \sqcup Child$$

- Type (domain and range) restrictions:

$$\forall x.(\forall y.(Affects(x,y) \rightarrow Arth(x) \wedge Person(y))) \rightsquigarrow \begin{aligned} \exists Affects.T \sqsubseteq Arth \\ T \sqsubseteq \forall Affects.Person \end{aligned}$$

Concept Inclusion Axioms & Definitions

Why call $C \sqsubseteq D$ a concept inclusion axiom?

- Intuitively, every object belonging to C should belong also to D
- States that C is more specific than D

Why call it a general concept inclusion axiom?

- It may be interesting to consider restricted forms of inclusion
- E.g., axioms where l.h.s. is atomic are sometimes called definitions
 - A concept definition specifies necessary and sufficient conditions for instances, e.g.:

$$JuvArth \equiv Arth \sqcap JuvDis$$

- A primitive concept definition specifies only necessary conditions for instances, e.g.:

$$Arth \sqsubseteq \exists Damages.Joint$$

Data Assertions

In description logics, we can also represent data:

<i>Child</i> (JohnSmith)	John Smith is a child
<i>JuvenileArthritis</i> (JRA)	JRA is a juvenile arthritis
<i>Affects</i> (JRA, MaryJones)	Mary Jones is affected by JRA

Usually **data assertions** correspond to FOL ground atoms.

Alternative notation: *JohnSmith* : *Child*, (*JRA*, *MaryJones*) : *Affects*

In \mathcal{ALC} , we have two types of data assertions, for a, b individuals:

$C(a)$	\rightsquigarrow	C is an \mathcal{ALC} concept
$R(a, b)$	\rightsquigarrow	R is an atomic role

Examples of acceptable data assertions in \mathcal{ALC} :

$\exists \textit{hasChild}.\textit{Teacher}(\textit{John})$	\rightsquigarrow	$\exists y.(\textit{hasChild}(\textit{John}, y) \wedge \textit{Teacher}(y))$
$\textit{HistorySt} \sqcup \textit{ClassicsSt}(\textit{John})$	\rightsquigarrow	$\textit{HistorySt}(\textit{John}) \vee \textit{ClassicsSt}(\textit{John})$

DL Knowledge Base: TBox + ABox

An \mathcal{ALC} knowledge base $\mathcal{K} = (\mathcal{T}, \mathcal{A})$ is composed of:

- A TBox \mathcal{T} (Terminological Component):
Finite set of GCIs
- An ABox \mathcal{A} (Assertional Component):
Finite set of assertions

TBox:

$JuvArthritis \sqsubseteq Arthritis \sqcap JuvDisease$
 $Arthritis \sqcap JuvDisease \sqsubseteq JuvArthritis$
 $Arthritis \sqsubseteq \exists Damages.Joint$
 $JuvDisease \sqsubseteq \forall Affects.(Child \sqcup Teen)$
 $Child \sqcup Teen \sqsubseteq \neg Adult$

ABox:

$Child(JohnSmith)$
 $JuvArthritis(JRA)$
 $Affects(JRA, MaryJones)$
 $Child \sqcup Teen(MaryJones)$

Semantics via FOL Translation

- Concepts translated as formulas with one free variable (except \top and \perp which are mapped to themselves):

$$\pi_x(A) = A(x)$$

$$\pi_y(A) = A(y)$$

$$\pi_x(\neg C) = \neg\pi_x(C)$$

$$\pi_y(\neg C) = \neg\pi_y(C)$$

$$\pi_x(C \sqcap D) = \pi_x(C) \wedge \pi_x(D)$$

$$\pi_y(C \sqcap D) = \pi_y(C) \wedge \pi_y(D)$$

$$\pi_x(C \sqcup D) = \pi_x(C) \vee \pi_x(D)$$

$$\pi_y(C \sqcup D) = \pi_y(C) \vee \pi_y(D)$$

$$\pi_x(\exists R.C) = \exists y.(R(x, y) \wedge \pi_y(C))$$

$$\pi_y(\exists R.C) = \exists x.(R(y, x) \wedge \pi_x(C))$$

$$\pi_x(\forall R.C) = \forall y.(R(x, y) \rightarrow \pi_y(C))$$

$$\pi_y(\forall R.C) = \forall x.(R(y, x) \rightarrow \pi_x(C))$$

- GCIs and assertions translated as sentences

$$\pi(C \sqsubseteq D) = \forall x.(\pi_x(C) \rightarrow \pi_x(D))$$

$$\pi(R(a, b)) = R(a, b)$$

$$\pi(C(a)) = \pi_x(C)[x/a]$$

- TBoxes, ABoxes and KBs are translated in the obvious way.

Semantics via FOL Translation

Note **redundancy** in concept-forming operators:

$$\begin{aligned}\perp &\rightsquigarrow \neg\top \\ C \sqcup D &\rightsquigarrow \neg(\neg C \sqcap \neg D) \\ \forall R.C &\rightsquigarrow \neg(\exists R.\neg C)\end{aligned}$$

These equivalences can be proved using FOL semantics:

$$\begin{aligned}\pi_x(\neg\exists R.\neg C) &= \neg\exists y.(R(x, y) \wedge \neg\pi_y(C)) \\ &\equiv \forall y.(\neg(R(x, y) \wedge \neg\pi_y(C))) \\ &\equiv \forall y.(\neg R(x, y) \vee \pi_y(C)) \\ &\equiv \forall y.(R(x, y) \rightarrow \pi_y(C)) \\ &= \pi_x(\forall R.C)\end{aligned}$$

We can define syntax of \mathcal{ALC} using **only conjunction and negation operators and the existential role operator**, considering all other operators as abbreviations.

Direct (Model-Theoretic) Semantics

Direct semantics: An alternative (and convenient) way of specifying semantics

DL interpretation $\mathcal{J} = \langle \Delta^{\mathcal{J}}, \cdot^{\mathcal{J}} \rangle$ is a FOL interpretation over the DL vocabulary:

- Each individual a interpreted as an object $a^{\mathcal{J}} \in \Delta^{\mathcal{J}}$.
- Each atomic concept A interpreted as a set $A^{\mathcal{J}} \subseteq \Delta^{\mathcal{J}}$.
- Each atomic role R interpreted as a binary relation $R^{\mathcal{J}} \subseteq \Delta^{\mathcal{J}} \times \Delta^{\mathcal{J}}$.

The mapping $\cdot^{\mathcal{J}}$ is extended to \top , \perp and compound concepts as follows:

$$\top^{\mathcal{J}} = \Delta^{\mathcal{J}}$$

$$\perp^{\mathcal{J}} = \emptyset$$

$$(\neg C)^{\mathcal{J}} = \Delta^{\mathcal{J}} \setminus C^{\mathcal{J}}$$

$$(C \sqcap D)^{\mathcal{J}} = C^{\mathcal{J}} \cap D^{\mathcal{J}}$$

$$(C \sqcup D)^{\mathcal{J}} = C^{\mathcal{J}} \cup D^{\mathcal{J}}$$

$$(\exists R.C)^{\mathcal{J}} = \{u \in \Delta^{\mathcal{J}} \mid \exists w \in \Delta^{\mathcal{J}} \text{ s.t. } \langle u, w \rangle \in R^{\mathcal{J}} \text{ and } w \in C^{\mathcal{J}}\}$$

$$(\forall R.C)^{\mathcal{J}} = \{u \in \Delta^{\mathcal{J}} \mid \forall w \in \Delta^{\mathcal{J}}, \langle u, w \rangle \in R^{\mathcal{J}} \text{ implies } w \in C^{\mathcal{J}}\}$$

Direct (Model-Theoretic) Semantics

Consider the interpretation $\mathcal{J} = \langle \Delta^{\mathcal{J}}, \cdot^{\mathcal{J}} \rangle$

$$\begin{aligned}\Delta^{\mathcal{J}} &= \{u, v, w\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} \\ \text{Child}^{\mathcal{J}} &= \{w\} \\ \text{Teen}^{\mathcal{J}} &= \emptyset \\ \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\}\end{aligned}$$

We can then interpret any concept as a subset of $\Delta^{\mathcal{J}}$:

$$\begin{aligned}(\text{JuvDis} \sqcap \text{Child})^{\mathcal{J}} &= \\ (\text{Child} \sqcup \text{Teen})^{\mathcal{J}} &= \\ (\exists \text{Affects} . (\text{Child} \sqcup \text{Teen}))^{\mathcal{J}} &= \\ (\neg \text{Child})^{\mathcal{J}} &= \\ (\forall \text{Affects} . \text{Teen})^{\mathcal{J}} &= \end{aligned}$$

Direct (Model-Theoretic) Semantics

Consider the interpretation $\mathcal{J} = \langle \Delta^{\mathcal{J}}, \cdot^{\mathcal{J}} \rangle$

$$\begin{aligned}\Delta^{\mathcal{J}} &= \{u, v, w\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} \\ \text{Child}^{\mathcal{J}} &= \{w\} \\ \text{Teen}^{\mathcal{J}} &= \emptyset \\ \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\}\end{aligned}$$

We can then interpret any concept as a subset of $\Delta^{\mathcal{J}}$:

$$\begin{aligned}(\text{JuvDis} \sqcap \text{Child})^{\mathcal{J}} &= \emptyset \\ (\text{Child} \sqcup \text{Teen})^{\mathcal{J}} &= \\ (\exists \text{Affects} . (\text{Child} \sqcup \text{Teen}))^{\mathcal{J}} &= \\ (\neg \text{Child})^{\mathcal{J}} &= \\ (\forall \text{Affects} . \text{Teen})^{\mathcal{J}} &= \end{aligned}$$

Direct (Model-Theoretic) Semantics

Consider the interpretation $\mathcal{J} = \langle \Delta^{\mathcal{J}}, \cdot^{\mathcal{J}} \rangle$

$$\begin{aligned}\Delta^{\mathcal{J}} &= \{u, v, w\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} \\ \text{Child}^{\mathcal{J}} &= \{w\} \\ \text{Teen}^{\mathcal{J}} &= \emptyset \\ \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\}\end{aligned}$$

We can then interpret any concept as a subset of $\Delta^{\mathcal{J}}$:

$$\begin{aligned}(\text{JuvDis} \sqcap \text{Child})^{\mathcal{J}} &= \emptyset \\ (\text{Child} \sqcup \text{Teen})^{\mathcal{J}} &= \{w\} \\ (\exists \text{Affects} . (\text{Child} \sqcup \text{Teen}))^{\mathcal{J}} &= \\ (\neg \text{Child})^{\mathcal{J}} &= \\ (\forall \text{Affects} . \text{Teen})^{\mathcal{J}} &= \end{aligned}$$

Direct (Model-Theoretic) Semantics

Consider the interpretation $\mathcal{J} = \langle \Delta^{\mathcal{J}}, \cdot^{\mathcal{J}} \rangle$

$$\begin{aligned}\Delta^{\mathcal{J}} &= \{u, v, w\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} \\ \text{Child}^{\mathcal{J}} &= \{w\} \\ \text{Teen}^{\mathcal{J}} &= \emptyset \\ \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\}\end{aligned}$$

We can then interpret any concept as a subset of $\Delta^{\mathcal{J}}$:

$$\begin{aligned}(\text{JuvDis} \sqcap \text{Child})^{\mathcal{J}} &= \emptyset \\ (\text{Child} \sqcup \text{Teen})^{\mathcal{J}} &= \{w\} \\ (\exists \text{Affects} . (\text{Child} \sqcup \text{Teen}))^{\mathcal{J}} &= \{u\} \\ (\neg \text{Child})^{\mathcal{J}} &= \\ (\forall \text{Affects} . \text{Teen})^{\mathcal{J}} &= \end{aligned}$$

Direct (Model-Theoretic) Semantics

Consider the interpretation $\mathcal{J} = \langle \Delta^{\mathcal{J}}, \cdot^{\mathcal{J}} \rangle$

$$\begin{aligned}\Delta^{\mathcal{J}} &= \{u, v, w\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} \\ \text{Child}^{\mathcal{J}} &= \{w\} \\ \text{Teen}^{\mathcal{J}} &= \emptyset \\ \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\}\end{aligned}$$

We can then interpret any concept as a subset of $\Delta^{\mathcal{J}}$:

$$\begin{aligned}(\text{JuvDis} \sqcap \text{Child})^{\mathcal{J}} &= \emptyset \\ (\text{Child} \sqcup \text{Teen})^{\mathcal{J}} &= \{w\} \\ (\exists \text{Affects} . (\text{Child} \sqcup \text{Teen}))^{\mathcal{J}} &= \{u\} \\ (\neg \text{Child})^{\mathcal{J}} &= \{u, v\} \\ (\forall \text{Affects} . \text{Teen})^{\mathcal{J}} &= \end{aligned}$$

Direct (Model-Theoretic) Semantics

Consider the interpretation $\mathcal{J} = \langle \Delta^{\mathcal{J}}, \cdot^{\mathcal{J}} \rangle$

$$\begin{aligned}\Delta^{\mathcal{J}} &= \{u, v, w\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} \\ \text{Child}^{\mathcal{J}} &= \{w\} \\ \text{Teen}^{\mathcal{J}} &= \emptyset \\ \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\}\end{aligned}$$

We can then interpret any concept as a subset of $\Delta^{\mathcal{J}}$:

$$\begin{aligned}(\text{JuvDis} \sqcap \text{Child})^{\mathcal{J}} &= \emptyset \\ (\text{Child} \sqcup \text{Teen})^{\mathcal{J}} &= \{w\} \\ (\exists \text{Affects} . (\text{Child} \sqcup \text{Teen}))^{\mathcal{J}} &= \{u\} \\ (\neg \text{Child})^{\mathcal{J}} &= \{u, v\} \\ (\forall \text{Affects} . \text{Teen})^{\mathcal{J}} &= \{v, w\}\end{aligned}$$

Direct (Model-Theoretic) Semantics

We can now determine whether \mathcal{J} is a **model of ...**

- A General Concept Inclusion Axiom $C \sqsubseteq D$:

$$\mathcal{J} \models (C \sqsubseteq D) \quad \text{iff} \quad C^{\mathcal{J}} \subseteq D^{\mathcal{J}}$$

- An assertion $C(a)$:

$$\mathcal{J} \models C(a) \quad \text{iff} \quad a^{\mathcal{J}} \in C^{\mathcal{J}}$$

- An assertion $R(a, b)$:

$$\mathcal{J} \models R(a, b) \quad \text{iff} \quad \langle a^{\mathcal{J}}, b^{\mathcal{J}} \rangle \in R^{\mathcal{J}}$$

- A TBox \mathcal{T} , ABox \mathcal{A} , and knowledge base:

$$\mathcal{J} \models \mathcal{T} \quad \text{iff} \quad \mathcal{J} \models \alpha \text{ for each } \alpha \in \mathcal{T}$$

$$\mathcal{J} \models \mathcal{A} \quad \text{iff} \quad \mathcal{J} \models \alpha \text{ for each } \alpha \in \mathcal{A}$$

$$\mathcal{J} \models \mathcal{K} \quad \text{iff} \quad \mathcal{J} \models \mathcal{T} \text{ and } \mathcal{J} \models \mathcal{A}$$

Direct (Model-Theoretic) Semantics: Examples

Consider our previous example interpretation:

$$\begin{aligned} \Delta^{\mathcal{J}} &= \{u, v, w\} & \textit{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\} \\ \textit{JuvDis}^{\mathcal{J}} &= \{u\} & \textit{Child}^{\mathcal{J}} &= \{w\} & \textit{Teen}^{\mathcal{J}} &= \emptyset \end{aligned}$$

\mathcal{J} is a model of the following axioms:

$$\begin{aligned} \textit{JuvDis} &\sqsubseteq \exists \textit{Affects}. \textit{Child} && \rightsquigarrow \\ \textit{Child} &\sqsubseteq \neg \textit{Teen} && \rightsquigarrow \\ \textit{JuvDis} &\sqsubseteq \forall \textit{Affects}. \textit{Child} && \rightsquigarrow \end{aligned}$$

However \mathcal{J} is not a model of the following axioms:

$$\begin{aligned} \textit{JuvDis} &\sqsubseteq \exists \textit{Affects}. (\textit{Child} \sqcap \textit{Teen}) && \rightsquigarrow \\ \neg \textit{Teen} &\sqsubseteq \textit{Child} && \rightsquigarrow \\ \exists \textit{Affects}. \top &\sqsubseteq \textit{Teen} && \rightsquigarrow \end{aligned}$$

Direct (Model-Theoretic) Semantics: Examples

Consider our previous example interpretation:

$$\begin{aligned} \Delta^{\mathcal{J}} &= \{u, v, w\} & \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} & \text{Child}^{\mathcal{J}} &= \{w\} & \text{Teen}^{\mathcal{J}} &= \emptyset \end{aligned}$$

\mathcal{J} is a model of the following axioms:

$$\begin{aligned} \text{JuvDis} \sqsubseteq \exists \text{Affects}.\text{Child} & \rightsquigarrow \{u\} \subseteq \{u\} \\ \text{Child} \sqsubseteq \neg \text{Teen} & \rightsquigarrow \\ \text{JuvDis} \sqsubseteq \forall \text{Affects}.\text{Child} & \rightsquigarrow \end{aligned}$$

However \mathcal{J} is not a model of the following axioms:

$$\begin{aligned} \text{JuvDis} \sqsubseteq \exists \text{Affects}.\text{(Child} \sqcap \text{Teen)} & \rightsquigarrow \\ \neg \text{Teen} \sqsubseteq \text{Child} & \rightsquigarrow \\ \exists \text{Affects}.\top \sqsubseteq \text{Teen} & \rightsquigarrow \end{aligned}$$

Direct (Model-Theoretic) Semantics: Examples

Consider our previous example interpretation:

$$\begin{aligned} \Delta^{\mathcal{J}} &= \{u, v, w\} & \textit{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\} \\ \textit{JuvDis}^{\mathcal{J}} &= \{u\} & \textit{Child}^{\mathcal{J}} &= \{w\} & \textit{Teen}^{\mathcal{J}} &= \emptyset \end{aligned}$$

\mathcal{J} is a model of the following axioms:

$$\begin{aligned} \textit{JuvDis} \sqsubseteq \exists \textit{Affects}.\textit{Child} &\rightsquigarrow \{u\} \subseteq \{u\} \\ \textit{Child} \sqsubseteq \neg \textit{Teen} &\rightsquigarrow \{w\} \subseteq \{u, v, w\} \\ \textit{JuvDis} \sqsubseteq \forall \textit{Affects}.\textit{Child} &\rightsquigarrow \end{aligned}$$

However \mathcal{J} is not a model of the following axioms:

$$\begin{aligned} \textit{JuvDis} \sqsubseteq \exists \textit{Affects}.\textit{Child} \sqcap \textit{Teen} &\rightsquigarrow \\ \neg \textit{Teen} \sqsubseteq \textit{Child} &\rightsquigarrow \\ \exists \textit{Affects}.\top \sqsubseteq \textit{Teen} &\rightsquigarrow \end{aligned}$$

Direct (Model-Theoretic) Semantics: Examples

Consider our previous example interpretation:

$$\begin{aligned} \Delta^{\mathcal{J}} &= \{u, v, w\} & \textit{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\} \\ \textit{JuvDis}^{\mathcal{J}} &= \{u\} & \textit{Child}^{\mathcal{J}} &= \{w\} & \textit{Teen}^{\mathcal{J}} &= \emptyset \end{aligned}$$

\mathcal{J} is a model of the following axioms:

$$\begin{aligned} \textit{JuvDis} \sqsubseteq \exists \textit{Affects}. \textit{Child} &\rightsquigarrow \{u\} \subseteq \{u\} \\ \textit{Child} \sqsubseteq \neg \textit{Teen} &\rightsquigarrow \{w\} \subseteq \{u, v, w\} \\ \textit{JuvDis} \sqsubseteq \forall \textit{Affects}. \textit{Child} &\rightsquigarrow \{u\} \subseteq \{u, v, w\} \end{aligned}$$

However \mathcal{J} is not a model of the following axioms:

$$\begin{aligned} \textit{JuvDis} \sqsubseteq \exists \textit{Affects}. (\textit{Child} \sqcap \textit{Teen}) &\rightsquigarrow \\ \neg \textit{Teen} \sqsubseteq \textit{Child} &\rightsquigarrow \\ \exists \textit{Affects}. \top \sqsubseteq \textit{Teen} &\rightsquigarrow \end{aligned}$$

Direct (Model-Theoretic) Semantics: Examples

Consider our previous example interpretation:

$$\begin{aligned} \Delta^{\mathcal{J}} &= \{u, v, w\} & \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} & \text{Child}^{\mathcal{J}} &= \{w\} & \text{Teen}^{\mathcal{J}} &= \emptyset \end{aligned}$$

\mathcal{J} is a model of the following axioms:

$$\begin{aligned} \text{JuvDis} \sqsubseteq \exists \text{Affects}.\text{Child} &\rightsquigarrow \{u\} \subseteq \{u\} \\ \text{Child} \sqsubseteq \neg \text{Teen} &\rightsquigarrow \{w\} \subseteq \{u, v, w\} \\ \text{JuvDis} \sqsubseteq \forall \text{Affects}.\text{Child} &\rightsquigarrow \{u\} \subseteq \{u, v, w\} \end{aligned}$$

However \mathcal{J} is not a model of the following axioms:

$$\begin{aligned} \text{JuvDis} \sqsubseteq \exists \text{Affects}.\text{(Child} \sqcap \text{Teen)} &\rightsquigarrow \{u\} \not\subseteq \emptyset \\ \neg \text{Teen} \sqsubseteq \text{Child} &\rightsquigarrow \\ \exists \text{Affects}.\top \sqsubseteq \text{Teen} &\rightsquigarrow \end{aligned}$$

Direct (Model-Theoretic) Semantics: Examples

Consider our previous example interpretation:

$$\begin{aligned} \Delta^{\mathcal{J}} &= \{u, v, w\} & \textit{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\} \\ \textit{JuvDis}^{\mathcal{J}} &= \{u\} & \textit{Child}^{\mathcal{J}} &= \{w\} & \textit{Teen}^{\mathcal{J}} &= \emptyset \end{aligned}$$

\mathcal{J} is a model of the following axioms:

$$\begin{aligned} \textit{JuvDis} \sqsubseteq \exists \textit{Affects}. \textit{Child} &\rightsquigarrow \{u\} \subseteq \{u\} \\ \textit{Child} \sqsubseteq \neg \textit{Teen} &\rightsquigarrow \{w\} \subseteq \{u, v, w\} \\ \textit{JuvDis} \sqsubseteq \forall \textit{Affects}. \textit{Child} &\rightsquigarrow \{u\} \subseteq \{u, v, w\} \end{aligned}$$

However \mathcal{J} is not a model of the following axioms:

$$\begin{aligned} \textit{JuvDis} \sqsubseteq \exists \textit{Affects}. (\textit{Child} \sqcap \textit{Teen}) &\rightsquigarrow \{u\} \not\subseteq \emptyset \\ \neg \textit{Teen} \sqsubseteq \textit{Child} &\rightsquigarrow \{u, v, w\} \not\subseteq \{w\} \\ \exists \textit{Affects}. \top \sqsubseteq \textit{Teen} &\rightsquigarrow \end{aligned}$$

Direct (Model-Theoretic) Semantics: Examples

Consider our previous example interpretation:

$$\begin{aligned} \Delta^{\mathcal{J}} &= \{u, v, w\} & \text{Affects}^{\mathcal{J}} &= \{\langle u, w \rangle\} \\ \text{JuvDis}^{\mathcal{J}} &= \{u\} & \text{Child}^{\mathcal{J}} &= \{w\} & \text{Teen}^{\mathcal{J}} &= \emptyset \end{aligned}$$

\mathcal{J} is a model of the following axioms:

$$\begin{aligned} \text{JuvDis} \sqsubseteq \exists \text{Affects}.\text{Child} &\rightsquigarrow \{u\} \subseteq \{u\} \\ \text{Child} \sqsubseteq \neg \text{Teen} &\rightsquigarrow \{w\} \subseteq \{u, v, w\} \\ \text{JuvDis} \sqsubseteq \forall \text{Affects}.\text{Child} &\rightsquigarrow \{u\} \subseteq \{u, v, w\} \end{aligned}$$

However \mathcal{J} is not a model of the following axioms:

$$\begin{aligned} \text{JuvDis} \sqsubseteq \exists \text{Affects}.\text{(Child} \sqcap \text{Teen)} &\rightsquigarrow \{u\} \not\subseteq \emptyset \\ \neg \text{Teen} \sqsubseteq \text{Child} &\rightsquigarrow \{u, v, w\} \not\subseteq \{w\} \\ \exists \text{Affects}.\top \sqsubseteq \text{Teen} &\rightsquigarrow \{u\} \not\subseteq \emptyset \end{aligned}$$

Conclusion

- Description Logics are a family of knowledge representation languages
- They can be seen as syntactic fragments of first-order predicate logic
- Only unary and binary predicate symbols, no function symbols (of positive arity)
- Use of quantification is restricted by *guards*
- *ALC* is the basic description logic
- Syntax of DLs: concepts (atomic/complex), general concept inclusions
- DL knowledge bases: consist of TBox and ABox
- Semantics of DLs: direct model-theoretic semantics (or translation to FOL)
