Complexity Theory

Exercise 9: Circuit Complexity

13th January 2026

Exercise 9.1. Define the function $\mathsf{maj}_n \colon \{0,1\}^n \to \{0,1\}$ by

$$\mathsf{maj}_n(x_1,\dots,x_n) := \begin{cases} 0 & \text{if } \sum x_i < n/2 \\ 1 & \text{if } \sum x_i \geq n/2. \end{cases}$$

Devise a circuit to compute maj_3 and test it on the example input 101 and 010.

Exercise 9.2. Denote with $\mathrm{add}\colon \{0,1\}^{2n} \to \{0,1\}^{n+1}$ the function that takes two binary n-bit numbers x and y and returns their $n+1$-bit sum. Show that add can be computed with size $\mathcal{O}(n)$ circuits.

Exercise 9.3. Show $\mathsf{NC}^1 \subseteq \mathsf{L}$.

Exercise 9.4. Show that every Boolean function with n variables can be computed with a circuit of size $\mathcal{O}(n \cdot 2^n)$.

Exercise 9.5. Show that every language $L \subseteq \{\, 1^n \mid n \in \mathbb{N} \,\}$ is contained in $\mathsf{P/poly}$. Conclude that $\mathsf{P/poly}$ contains undecidable languages.

Exercise 9.6. Find a decidable language in $\mathsf{P/poly}$ that is not contained in P.

Hint:
Take a language over $\{\, 0, 1 \,\}$ that is $\mathsf{2ExpTime}$-hard and consider its unary encoding.

Exercise 9.7. Show how to compute maj_n with circuits of size $\mathcal{O}(n \log n)$.

Exercise 9.8. Show that $\mathrm{NC} \neq \mathrm{PSPACE}$.
