# Existential Rules – Lecture 3

Adapted from slides by Andreas Pieris and Michaël Thomazo  
Summer Term 2023

# Syntax of Existential Rules

An **existential rule** is an expression

$$\forall \mathbf{X} \forall \mathbf{Y} (\underbrace{\varphi(\mathbf{X}, \mathbf{Y})}_{\text{body}} \rightarrow \exists \mathbf{Z} \underbrace{\psi(\mathbf{X}, \mathbf{Z})}_{\text{head}})$$

- $\mathbf{X}, \mathbf{Y}$  and  $\mathbf{Z}$  are tuples of variables of  $\mathbf{V}$
- $\varphi(\mathbf{X}, \mathbf{Y})$  and  $\psi(\mathbf{X}, \mathbf{Z})$  are (constant-free) conjunctions of atoms

...a.k.a. tuple-generating dependencies, and Datalog<sup>±</sup> rules

# Semantics of Existential Rules

- An instance  $J$  is a **model** of the rule

$$\sigma = \forall \mathbf{X} \forall \mathbf{Y} (\varphi(\mathbf{X}, \mathbf{Y}) \rightarrow \exists \mathbf{Z} \psi(\mathbf{X}, \mathbf{Z}))$$

written as  $J \models \sigma$ , if the following holds:

whenever there exists a homomorphism  $h$  such that  $h(\varphi(\mathbf{X}, \mathbf{Y})) \subseteq J$ ,

then there exists  $g \supseteq h|_{\mathbf{X}}$  such that  $g(\psi(\mathbf{X}, \mathbf{Z})) \subseteq J$

$\{t \mapsto h(t) \mid t \in \mathbf{X}\}$  – the **restriction** of  $h$  to  $\mathbf{X}$

- Given a set  $\Sigma$  of existential rules,  $J$  is a **model** of  $\Sigma$ , written as  $J \models \Sigma$ , if the following holds: for each  $\sigma \in \Sigma$ ,  $J \models \sigma$
- It can be shown that  $J \models \Sigma$  iff  $J$  is a model of the first-order theory  $\bigwedge_{\sigma \in \Sigma} \sigma$

# Ontology-Based Query Answering (OBQA)

**existential rules**

$$\forall X \forall Y (\varphi(X, Y) \rightarrow \exists Z \psi(X, Z))$$

# Syntax of Conjunctive Queries

A **conjunctive query (CQ)** is an expression

$$\exists \mathbf{Y} (\varphi(\mathbf{X}, \mathbf{Y}))$$

- $\mathbf{X}$  and  $\mathbf{Y}$  are tuples of variables of  $\mathbf{V}$
- $\varphi(\mathbf{X}, \mathbf{Y})$  is a conjunction of atoms (possibly with constants)

The most important query language used in practice

Forms the **SELECT-FROM-WHERE** fragment of SQL

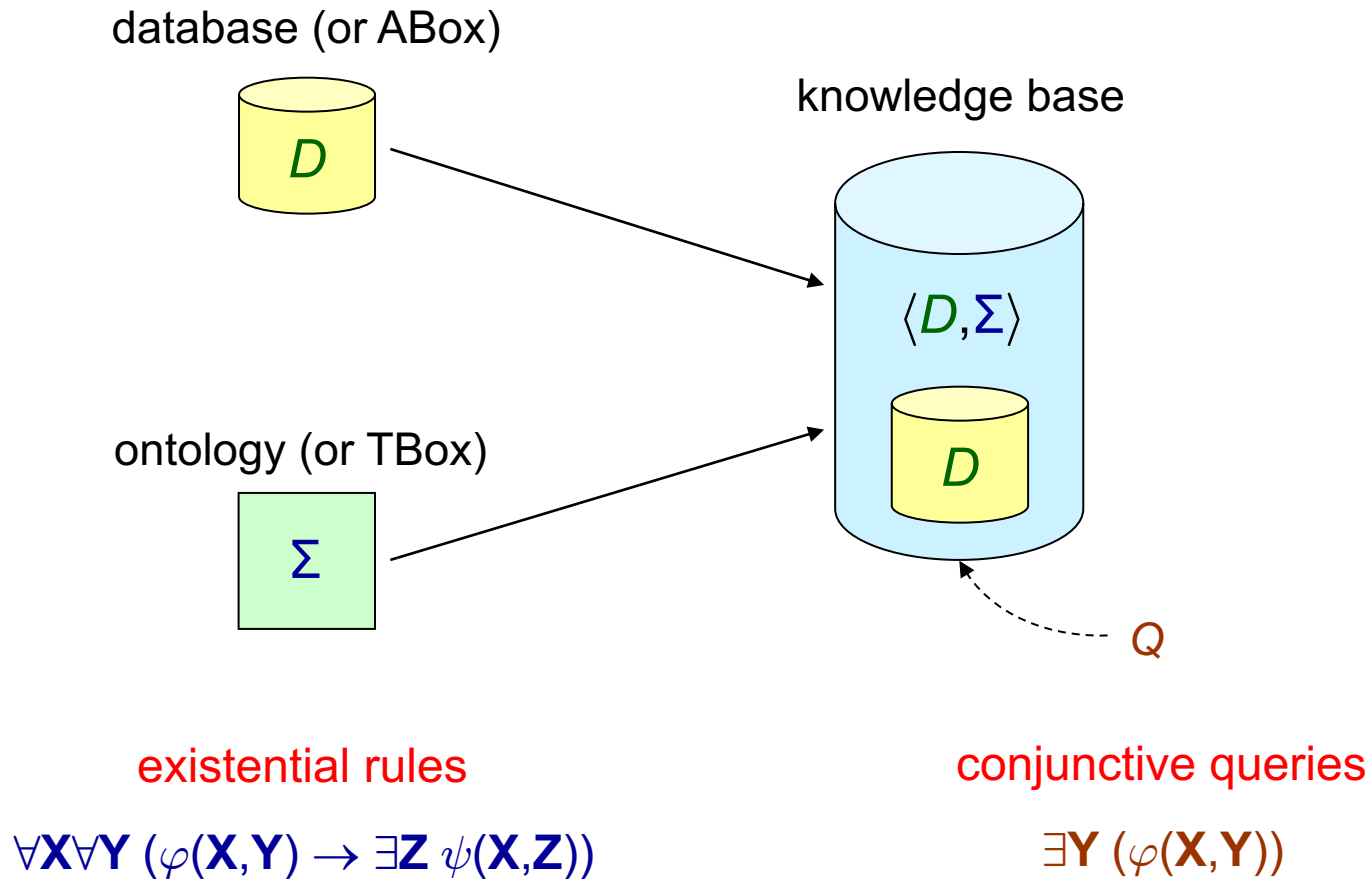

# Semantics of Conjunctive Queries

- A **match** of a CQ  $\exists \mathbf{Y} (\varphi(\mathbf{X}, \mathbf{Y}))$  in an instance  $J$  is a homomorphism  $h$  such that  $h(\varphi(\mathbf{X}, \mathbf{Y})) \subseteq J$  i.e., all the atoms of the query are satisfied
- The **answer** to  $Q = \exists \mathbf{Y} (\varphi(\mathbf{X}, \mathbf{Y}))$  over  $J$  is the set of tuples
$$Q(J) = \{h(\mathbf{X}) \mid h \text{ is a match of } Q \text{ in } J\}$$
- The answer consists of the witnesses for the **free variables** of the query

# Ontology-Based Query Answering (OBQA)

# OBQA: Formal Definition

active domain – constants occurring in  $D$

CQ-Answering:

Input: database  $D$ , existential rules  $\Sigma$ , CQ  $Q = \exists \mathbf{Y} (\varphi(\mathbf{X}, \mathbf{Y}))$ , tuple  $\mathbf{t} \in \text{adom}(D)^{|\mathbf{X}|}$

Question: decide whether  $\mathbf{t} \in \text{certain}(Q, \langle D, \Sigma \rangle) = \bigcap_{J \in \text{models}(D \wedge \Sigma)} Q(J)_{\downarrow}$

$$\mathbf{t} \in \text{certain}(Q, \langle D, \Sigma \rangle) \quad \text{iff} \quad \mathbf{t} \in \bigcap_{J \in \text{models}(D \wedge \Sigma)} Q(J)_{\downarrow}$$

$$\text{iff} \quad \forall J \in \text{models}(D \wedge \Sigma), J \models \exists \mathbf{Y} (\varphi(\mathbf{t}, \mathbf{Y}))$$

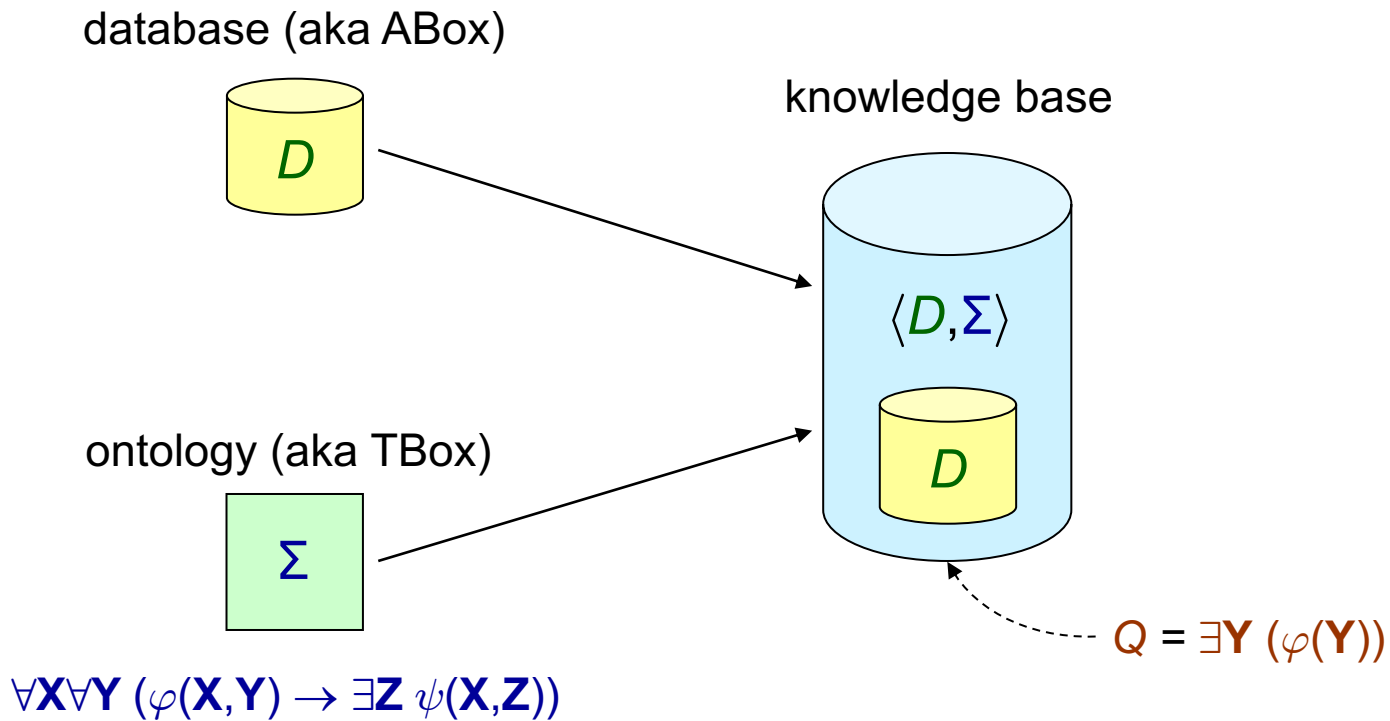

$$\text{iff} \quad D \wedge \Sigma \models \exists \mathbf{Y} (\varphi(\mathbf{t}, \mathbf{Y}))$$

Boolean CQ (BCQ) – no free variables

# BCQ-Answering: Our Main Decision Problem

decide whether  $D \wedge \Sigma \models Q$

# Universal Models (a.k.a. Canonical Models)

An instance  $U$  is a **universal model** of  $D \wedge \Sigma$  if the following holds:

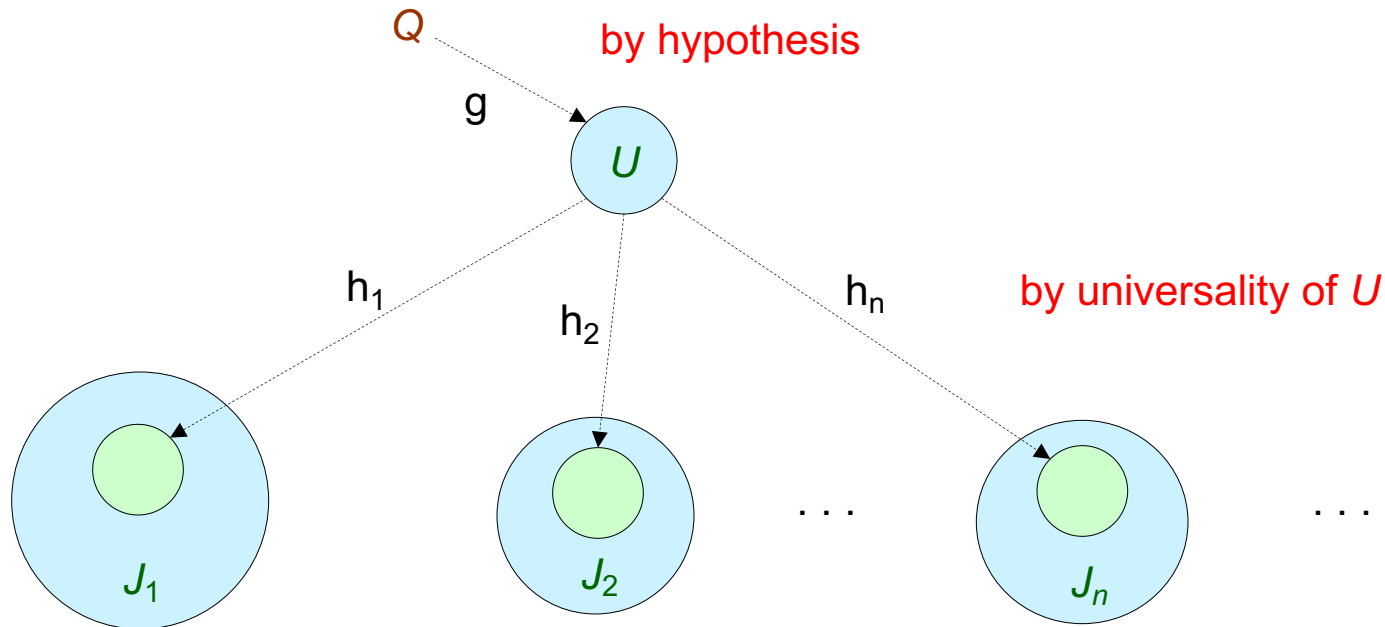

1.  $U$  is a model of  $D \wedge \Sigma$
2.  $\forall J \in \text{models}(D \wedge \Sigma)$ , there exists a homomorphism  $h_J$  such that  $h_J(U) \subseteq J$

# Query Answering via Universal Models

Theorem:  $D \wedge \Sigma \models Q$  iff  $U \models Q$ , where  $U$  is a universal model of  $D \wedge \Sigma$

Proof:  $(\Rightarrow)$  Trivial since, for every  $J \in \text{models}(D \wedge \Sigma)$ ,  $J \models Q$

$(\Leftarrow)$  By exploiting the universality of  $U$

$$\forall J \in \text{models}(D \wedge \Sigma), \exists h_J \text{ such that } h_J(g(Q)) \subseteq J \Rightarrow \forall J \in \text{models}(D \wedge \Sigma), J \models Q$$

$$\Rightarrow D \wedge \Sigma \models Q$$

# The Chase Procedure

- **Fundamental algorithmic tool** used in databases
- It has been applied to a **wide range of problems**:
  - Checking containment of queries under constraints
  - Computing data exchange solutions
  - Computing certain answers in data integration settings
  - ...

... what's the reason for the ubiquity of the chase in databases?

**it constructs universal models**

# The Chase Procedure

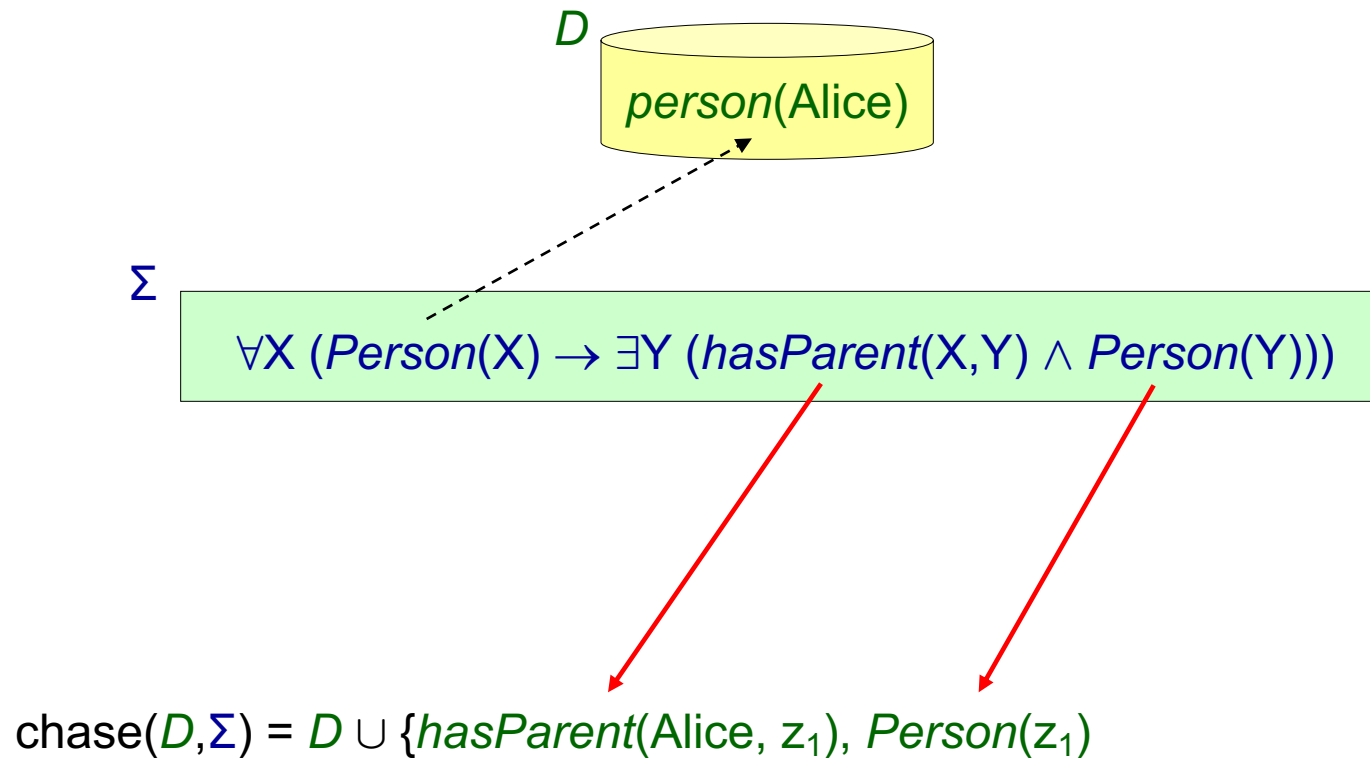

$\Sigma$

$\forall X (Person(X) \rightarrow \exists Y (hasParent(X,Y) \wedge Person(Y)))$

$chase(D, \Sigma) = D \cup$

# The Chase Procedure

# The Chase Procedure

$\Sigma$

$\forall X (Person(X) \rightarrow \exists Y (hasParent(X,Y) \wedge Person(Y)))$

$chase(D, \Sigma) = D \cup \{hasParent(Alice, z_1), Person(z_1),$

$hasParent(z_1, z_2), Person(z_2)\}$

# The Chase Procedure

$\Sigma$

$\forall X (Person(X) \rightarrow \exists Y (hasParent(X,Y) \wedge Person(Y)))$

$chase(D, \Sigma) = D \cup \{hasParent(Alice, z_1), Person(z_1),$

$hasParent(z_1, z_2), Person(z_2),$

$hasParent(z_2, z_3), Person(z_3)\}$

# The Chase Procedure

$\Sigma$

$\forall X (Person(X) \rightarrow \exists Y (hasParent(X, Y) \wedge Person(Y)))$

$chase(D, \Sigma) = D \cup \{hasParent(Alice, z_1), Person(z_1),$

$hasParent(z_1, z_2), Person(z_2),$

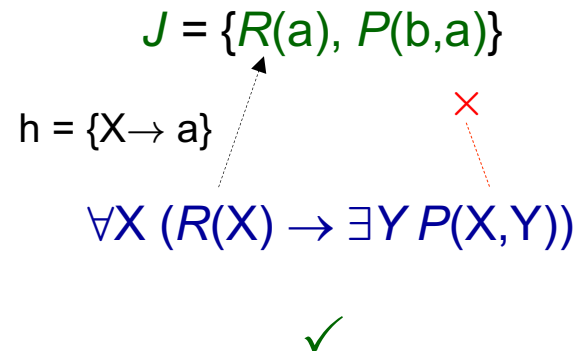

$hasParent(z_2, z_3), Person(z_3), \dots$

infinite instance

# The Chase Procedure: Formal Definition

- **Chase rule** - the building block of the chase procedure
- A rule  $\sigma = \forall \mathbf{X} \forall \mathbf{Y} (\varphi(\mathbf{X}, \mathbf{Y}) \rightarrow \exists \mathbf{Z} \psi(\mathbf{X}, \mathbf{Z}))$  is **applicable** to instance  $J$  if:
  1. There exists a homomorphism  $h$  such that  $h(\varphi(\mathbf{X}, \mathbf{Y})) \subseteq J$
  2. There is no  $g \supseteq h_{|X}$  such that  $g(\psi(\mathbf{X}, \mathbf{Z})) \subseteq J$

# The Chase Procedure: Formal Definition

- **Chase rule** - the building block of the chase procedure
- A rule  $\sigma = \forall \mathbf{X} \forall \mathbf{Y} (\varphi(\mathbf{X}, \mathbf{Y}) \rightarrow \exists \mathbf{Z} \psi(\mathbf{X}, \mathbf{Z}))$  is **applicable** to instance  $J$  if:
  1. There exists a homomorphism  $h$  such that  $h(\varphi(\mathbf{X}, \mathbf{Y})) \subseteq J$
  2. There is no  $g \supseteq h|_{\mathbf{X}}$  such that  $g(\psi(\mathbf{X}, \mathbf{Z})) \subseteq J$
- Let  $J_+ = J \cup \{g(\psi(\mathbf{X}, \mathbf{Z}))\}$ , where  $g \supseteq h|_{\mathbf{X}}$  and  $g(\mathbf{Z})$  are “fresh” nulls not in  $J$
- The result of applying  $\sigma$  to  $J$  is  $J_+$ , denoted  $J \langle \sigma, h \rangle J_+$  - **single chase step**

# The Chase Procedure: Formal Definition

- A **finite chase** of  $D$  w.r.t.  $\Sigma$  is a finite sequence

$$D \langle \sigma_1, h_1 \rangle J_1 \langle \sigma_2, h_2 \rangle J_2 \langle \sigma_3, h_3 \rangle J_3 \dots \langle \sigma_n, h_n \rangle J_n$$

where no rule from  $\Sigma$  is applicable in  $J_n$ .

Then,  $\text{chase}(D, \Sigma)$  is defined as the instance  $J_n$

all applicable rules will eventually be applied

- An **infinite chase** of  $D$  w.r.t.  $\Sigma$  is a **fair** finite sequence

$$D \langle \sigma_1, h_1 \rangle J_1 \langle \sigma_2, h_2 \rangle J_2 \langle \sigma_3, h_3 \rangle J_3 \dots \langle \sigma_n, h_n \rangle J_n \dots$$

and  $\text{chase}(D, \Sigma)$  is **defined** as the instance  $\bigcup_{k \geq 0} J_k$  (with  $J_0 = D$ )

least fixpoint of a monotonic operator - chase step

# Chase: A Universal Model

Theorem:  $\text{chase}(D, \Sigma)$  is a universal model of  $D \wedge \Sigma$

the result of the chase after  $k$  applications of the chase step

Proof:

- By construction,  $\text{chase}(D, \Sigma) \in \text{models}(D \wedge \Sigma)$
- It remains to show that  $\text{chase}(D, \Sigma)$  can be homomorphically embedded into every other model of  $D \wedge \Sigma$
- Fix an arbitrary instance  $J \in \text{models}(D \wedge \Sigma)$ . We need to show that there exists  $h$  such that  $h(\text{chase}(D, \Sigma)) \subseteq J$
- By induction on the number of applications of the chase step, we show that for every  $k \geq 0$ , there exists  $h_k$  such that  $h_k(\text{chase}^{[k]}(D, \Sigma)) \subseteq J$ , and  $h_k$  is compatible with  $h_{k-1}$
- Clearly,  $\cup_{k \geq 0} h_k$  is a well-defined homomorphism that maps  $\text{chase}(D, \Sigma)$  to  $J$
- The claim follows with  $h = \cup_{k \geq 0} h_k$

# Chase: Uniqueness Property

- The result of the chase is **not unique** - depends on the order of rule application

$$D = \{P(a)\} \quad \sigma_1 = \forall X (P(X) \rightarrow \exists Y R(Y)) \quad \sigma_2 = \forall X (P(X) \rightarrow R(X))$$

$$\text{Result}_1 = \{P(a), R(z), R(a)\} \quad \sigma_1 \text{ then } \sigma_2$$

$$\text{Result}_2 = \{P(a), R(a)\} \quad \sigma_2 \text{ then } \sigma_1$$

- But, it is **unique up to homomorphic equivalence**

- Thus, it is **unique** for query answering purposes

# Query Answering via the Chase

Theorem:  $D \wedge \Sigma \models Q$  iff  $U \models Q$ , where  $U$  is a universal model of  $D \wedge \Sigma$

+

Theorem:  $\text{chase}(D, \Sigma)$  is a universal model of  $D \wedge \Sigma$

=

Corollary:  $D \wedge \Sigma \models Q$  iff  $\text{chase}(D, \Sigma) \models Q$

- We can tame the first dimension of infinity by exploiting the chase procedure
- But, **what about the second dimension of infinity?** - the chase may be infinite

# Rest of the Lecture

- Undecidability of BCQ-Answering
- Gaining decidability - terminating chase
- Full Existential Rules
- Acyclic Existential Rules

# Undecidability of BCQ-Answering

Theorem: BCQ-Answering is **undecidable**

Proof : By simulating a deterministic Turing machine with an empty tape

# Deterministic Turing Machine (DTM)

$$\delta(s_1, \alpha) = (s_2, \beta, +1)$$

IF at some time instant  $\tau$  the machine is in state  $s_1$ , the cursor points to cell  $\kappa$ , and this cell contains  $\alpha$

THEN at instant  $\tau+1$  the machine is in state  $s_2$ , cell  $\kappa$  contains  $\beta$ , and the cursor points to cell  $\kappa+1$

# Undecidability of BCQ-Answering

Our Goal: Encode the computation of a DTM  $M$  with an empty tape using a database  $D$ , a set  $\Sigma$  of existential rules, and a BCQ  $Q$  such that

$$D \wedge \Sigma \models Q \text{ iff } M \text{ accepts}$$

# Build an Infinite Grid

$k$ -th horizontal line represents the  
 $k$ -th configuration of the machine

$$D = \{Start(c)\}$$

fixes the origin of the grid

$$\forall X (Start(X) \rightarrow Node(X) \wedge Initial(X))$$

$$\forall X (Node(X) \rightarrow \exists Y (H(X,Y) \wedge Node(Y)))$$

$$\forall X (Node(X) \rightarrow \exists Y (V(X,Y) \wedge Node(Y)))$$

$$\forall X \forall Y \forall Z \forall W (H(X,Y) \wedge H(Z,W) \wedge V(X,Z) \rightarrow V(Y,W))$$

# Initialization Rules

$$\forall X \forall Y (Initial(X) \wedge H(X, Y) \rightarrow Initial(Y))$$

$$\forall X (Start(X) \rightarrow Cursor[s_0](X))$$

$$\forall X (Initial(X) \rightarrow Symbol[\square](X))$$

# Transition Rules

$$\delta(s_1, \alpha) = (s_2, \beta, +1)$$

$\forall X \forall Y \forall Z (Cursor[s_1](X) \wedge Symbol[\alpha](X) \wedge V(X, Y) \wedge H(Y, Z) \rightarrow$

$Cursor[s_2](Z) \wedge Symbol[\beta](Y) \wedge Mark(X))$

# Inertia Rules

$$\forall X \forall Y (Mark(X) \wedge H(X, Y) \rightarrow AfterCursor(Y))$$

$$\forall X \forall Y (AfterCursor(X) \wedge H(X, Y) \rightarrow AfterCursor(Y))$$

$$\forall X \forall Y (AfterCursor(X) \wedge Symbol[\alpha](X) \wedge V(X, Y) \rightarrow Symbol[\alpha](Y))$$

...we have similar rules for the **cells before the cursor**

# Accepting Rule

Once we reach the accepting state we accept

$$\forall X (\text{Cursor}[s_{\text{acc}}](X) \rightarrow \text{Accept}(X))$$

$D \wedge \Sigma \models \exists X \text{Accept}(X)$  iff the DTM  $M$  accepts

# Undecidability of BCQ-Answering

Theorem: BCQ-Answering is **undecidable**

Proof : By simulating a deterministic Turing machine with an empty tape

**...syntactic restrictions are needed!!!**
