

Exercise Sheet 8: Datalog
 Lukas Gerlach, Markus Krötzsch
 Database Theory, 2025-06-03, Summer Term 2025

Exercise 8.1. Consider the example Datalog program from the lecture:

father(alice, bob)	(0.1)
mother(alice, carla)	(0.2)
mother(ewan, carla)	(0.3)
father(carla, david)	(0.4)
Parent(x, y) \leftarrow father(x, y)	(0.5)
Parent(x, y) \leftarrow mother(x, y)	(0.6)
Ancestor(x, y) \leftarrow Parent(x, y)	(0.7)
Ancestor(x, z) \leftarrow Parent(x, y) \wedge Ancestor(y, z)	(0.8)
SameGeneration(x, x)	(0.9)
SameGeneration(x, y) \leftarrow Parent(x, v) \wedge Parent(y, w) \wedge SameGeneration(v, w)	(0.10)

1. Give a proof tree for SameGeneration(ewan, alice).
2. Compute the sets $T_P^0, T_P^1, T_P^2, \dots$. When is the fixed point reached?

Exercise 8.2. Consider databases that encode a labelled, directed graph by means of a ternary EDB predicate e (“edge”). The two parameters are the source and target nodes of the edge, while the third parameter is its label. For example, the edge $n_1 \xrightarrow{a} n_2$ would be represented by the fact $e(n_1, n_2, a)$. Moreover, assume that only constants a and b are used as labels.

Can you express the following queries using Datalog?

1. “Which nodes in the graph are reachable from the node n ?”
2. “Are all nodes of the graph reachable from the node n ?”
3. “Does the graph have a directed cycle?”
4. “Does the graph have a path that is labelled by a palindrome?”
(a palindrome is a word that reads the same forwards and backwards)
5. “Is the connected component that contains the node n 2-colourable?”
6. “Is the graph 2-colourable?”
7. “Which pairs of nodes are connected by a path with an even number of a labels?”
8. “Which pairs of nodes are connected by a path with the same number of a and b labels?”
9. “Is there a pair of nodes that is connected by two distinct paths?”

Exercise 8.3. Consider a UCQ of the following form

$$(r_{11}(x) \wedge r_{12}(x)) \vee \dots \vee (r_{\ell 1}(x) \wedge r_{\ell 2}(x))$$

Find a Datalog query that expresses this UCQ. How many rules and how many additional IDB predicates does your solution use (depending on ℓ)?

Exercise 8.4. Consider a Datalog query of the following form:

$$\begin{array}{lll} A_1(x) \leftarrow r_{11}(x) & \dots & A_\ell(x) \leftarrow r_{\ell 1}(x) \\ A_1(x) \leftarrow r_{12}(x) & \dots & A_\ell(x) \leftarrow r_{\ell 2}(x) \\ \text{Ans}(x) \leftarrow A_1(x) \wedge \dots \wedge A_\ell(x) \end{array}$$

Find a UCQ that expresses this Datalog query. How many CQs does your solution contain (depending on ℓ)?

Exercise 8.5. Show that T_P^∞ is the least fixed point of the T_P operator.

1. Show that it is a fixed point, i.e., that $T_P(T_P^\infty) = T_P^\infty$.
2. Show that every fixed point of T_P must contain every fact in T_P^∞ .
