## Normal logic programs

- A **logic program**,  $P$ , over a set  $\mathcal{A}$  of atoms is a finite **set** of rules
- A (normal) **rule**,  $r$ , is of the form

$$a_0 \leftarrow a_1, \dots, a_m, \sim a_{m+1}, \dots, \sim a_n$$

where  $0 \leq m \leq n$  and each  $a_i \in \mathcal{A}$  is an atom for  $0 \leq i \leq n$

### Notation

$$\text{head}(r) = a_0$$

$$\text{body}(r) = \{a_1, \dots, a_m, \sim a_{m+1}, \dots, \sim a_n\}$$

$$\text{body}(r)^+ = \{a_1, \dots, a_m\}$$

$$\text{body}(r)^- = \{a_{m+1}, \dots, a_n\}$$

$$\text{atom}(P) = \bigcup_{r \in P} (\{\text{head}(r)\} \cup \text{body}(r)^+ \cup \text{body}(r)^-)$$

$$\text{body}(P) = \{\text{body}(r) \mid r \in P\}$$

- A program  $P$  is **positive** if  $\text{body}(r)^- = \emptyset$  for all  $r \in P$

## Formal Definition

### Stable models of positive programs

- A set of atoms  $X$  is **closed under** a positive program  $P$  iff for any  $r \in P$ ,  $head(r) \in X$  whenever  $body(r)^+ \subseteq X$ 
  - $X$  corresponds to a model of  $P$  (seen as a formula)
- The **smallest** set of atoms which is closed under a positive program  $P$  is denoted by  $Cn(P)$ 
  - $Cn(P)$  corresponds to the  $\subseteq$ -smallest model of  $P$  (ditto)
- The set  $Cn(P)$  of atoms is the **stable model** of a *positive program*  $P$

## Formal Definition

### Stable model of normal programs

- The **reduct**,  $P^X$ , of a program  $P$  relative to a set  $X$  of atoms is defined by

$$P^X = \{ \text{head}(r) \leftarrow \text{body}(r)^+ \mid r \in P \text{ and } \text{body}(r)^- \cap X = \emptyset \}$$

- A set  $X$  of atoms is a **stable model** of a program  $P$ , if  $Cn(P^X) = X$
- Note  $Cn(P^X)$  is the  $\subseteq$ -smallest (classical) model of  $P^X$
- Note Every atom in  $X$  is justified by an *“applying rule from  $P$ ”*

A closer look at  $P^X$ 

- In other words, given a set  $X$  of atoms from  $P$ ,

$P^X$  is obtained from  $P$  by **deleting**

- 1 each **rule** having  $\sim a$  in its body with  $a \in X$  and then
- 2 all **negative atoms** of the form  $\sim a$  in the bodies of the remaining rules

- Note Only negative body literals are evaluated wrt  $X$
