

COMPLEXITY THEORY

Lecture 1: Introduction and Motivation

Markus Krötzsch, Stephan Mennicke, and Sergei Obiedkov
Knowledge-Based Systems

TU Dresden, 13 October 2025

More recent versions of this slide deck might be available.
For the most current version of this course, see

Lecture Notes

Slides of current and past lectures will be online.

Goals and Prerequisites

Goals

- Introduce basic notions of **computational complexity theory**
- Introduce **commonly known complexity classes** (P , NP , $PSPACE$, ...) and discuss relationships between them
- Develop **tools to classify problems** into their corresponding complexity classes
- Introduce some **advanced topics of complexity theory** (e.g., circuits, probabilistic computation, quantum computing)

Goals and Prerequisites

Goals

- Introduce basic notions of **computational complexity theory**
- Introduce **commonly known complexity classes** (P , NP , $PSPACE$, ...) and discuss relationships between them
- Develop **tools to classify problems** into their corresponding complexity classes
- Introduce some **advanced topics of complexity theory** (e.g., circuits, probabilistic computation, quantum computing)

(Non-)Prerequisites

- No particular prior courses needed
- Prior acquaintance with Turing Machines and basic topics in formal languages and complexity is helpful
- General mathematical and theoretical computer science skills necessary

Reading List

- **Michael Sipser: Introduction to the Theory of Computation, International Edition; 3rd Edition; Cengage Learning 2013**
- Sanjeev Arora and Boaz Barak: **Computational Complexity: A Modern Approach**; Cambridge University Press 2009
- Michael R. Garey and David S. Johnson: **Computers and Intractability**; Bell Telephone Laboratories, Inc. 1979
- Erich Grädel: **Complexity Theory**; Lecture Notes, Winter Term 2009/10
- John E. Hopcroft and Jeffrey D. Ullman: **Introduction to Automata Theory, Languages, and Computation**; Addison Wesley Publishing Company 1979
- Christos H. Papadimitriou: **Computational Complexity**; 1995 Addison-Wesley Publishing Company, Inc

Computational Problems are Everywhere

Example 1.1:

- What are the factors of 54,623?
- What is the shortest route by car from Berlin to Hamburg?
- My program now runs for two weeks. Will it ever stop?
- Is this C++ program syntactically correct?

Computational Problems are Everywhere

Example 1.1:

- What are the factors of 54,623?
- What is the shortest route by car from Berlin to Hamburg?
- My program now runs for two weeks. Will it ever stop?
- Is this C++ program syntactically correct?

Clear

Computational Problems are ubiquitous in our everyday life!

And, depending on what we want to do, those problems might be either **easily solvable** or **hardly solvable**.

Computational Problems are Everywhere

Example 1.1:

- What are the factors of 54,623?
- What is the shortest route by car from Berlin to Hamburg?
- My program now runs for two weeks. Will it ever stop?
- Is this C++ program syntactically correct?

Clear

Computational Problems are ubiquitous in our everyday life!

And, depending on what we want to do, those problems might be either **easily solvable** or **hardly solvable**.

Approach to problems:

[T]he way is to avoid what is strong, and strike at what is weak.

(Sun Tzu: The Art of War, Chapter 6: Weak Points and Strong)

Examples

Examples

Example 1.2 (Shortest Path Problem): Given a weighted graph and two vertices s, t , find the shortest path between s and t .

Examples

Example 1.2 (Shortest Path Problem): Given a weighted graph and two vertices s, t , find the shortest path between s and t .

Easily solvable using, e.g., Dijkstra's Algorithm.

Examples

Example 1.2 (Shortest Path Problem): Given a weighted graph and two vertices s, t , find the shortest path between s and t .

Easily solvable using, e.g., Dijkstra's Algorithm.

Example 1.3 (Longest Path Problem): Given a weighted graph and two vertices s, t , find the **longest** path between s and t .

Examples

Example 1.2 (Shortest Path Problem): Given a weighted graph and two vertices s, t , find the shortest path between s and t .

Easily solvable using, e.g., Dijkstra's Algorithm.

Example 1.3 (Longest Path Problem): Given a weighted graph and two vertices s, t , find the **longest** path between s and t .

No efficient algorithm known, and believed to not exist (this problem is **NP-hard**)

Examples

Example 1.2 (Shortest Path Problem): Given a weighted graph and two vertices s, t , find the shortest path between s and t .

Easily solvable using, e.g., Dijkstra's Algorithm.

Example 1.3 (Longest Path Problem): Given a weighted graph and two vertices s, t , find the **longest** path between s and t .

No efficient algorithm known, and believed to not exist (this problem is **NP-hard**)

Observation

Difficulty of a problem is hard to assess

Measuring the Difficulty of Problems

Question

How can we measure the complexity of a problem?

Measuring the Difficulty of Problems

Question

How can we measure the complexity of a problem?

Approach

Estimate the resource requirements of the “best” algorithm that solves this problem.

Typical Resources:

- Running Time
- Memory Used

Measuring the Difficulty of Problems

Question

How can we measure the complexity of a problem?

Approach

Estimate the resource requirements of the “best” algorithm that solves this problem.

Typical Resources:

- Running Time
- Memory Used

Note

To assess the complexity of a problem, we need to consider **all possible algorithms** that solve this problem.

Problems

What actually is ... a Problem?

(Decision) Problems are **word problems** of particular languages.

Problems

What actually is ... a Problem?

(Decision) Problems are **word problems** of particular languages.

Example 1.4: “Problem: Is a given graph connected?” will be modelled as the word problem of the language

$$\text{GCONN} := \{ \langle G \rangle \mid G \text{ is a connected graph} \}.$$

Then for a graph G we have

$$G \text{ is connected} \iff \langle G \rangle \in \text{GCONN}.$$

Note

The notation $\langle G \rangle$ denotes a **suitable encoding** of the graph G over some fixed alphabet (e.g., $\{0, 1\}$).

Algorithms

What actually is ... an Algorithm?

Algorithms

What actually is ... an Algorithm?

Different approaches to formalise the notion of an “algorithm”

- Turing Machines
- Lambda Calculus
- μ -Recursion
- ...

Avoid What is Strong

Avoid What is Strong

Suppose we are given a language $\mathcal{L}$ and a word w .

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Avoid What is Strong

Suppose we are given a language $\mathcal{L}$ and a word w .

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Avoid What is Strong

Suppose we are given a language $\mathcal{L}$ and a word w .

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Example 1.5:

Avoid What is Strong

Suppose we are given a language $\mathcal{L}$ and a word w .

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Example 1.5:

- The Halting Problem of Turing machines

Avoid What is Strong

Suppose we are given a language $\mathcal{L}$ and a word w .

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Example 1.5:

- The Halting Problem of Turing machines
- The Entscheidungsproblem (Is a first-order logical statement true?)

Avoid What is Strong

Suppose we are given a language $\mathcal{L}$ and a word w .

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Example 1.5:

- The Halting Problem of Turing machines
- The Entscheidungsproblem (Is a first-order logical statement true?)
- Finding the lowest air fare between two cities ($\rightarrow$ Reference)

Avoid What is Strong

Suppose we are given a language $\mathcal{L}$ and a word w .

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Example 1.5:

- The Halting Problem of Turing machines
- The Entscheidungsproblem (Is a first-order logical statement true?)
- Finding the lowest air fare between two cities ($\rightarrow$ Reference)
- Deciding syntactic validity of C++ programs ($\rightarrow$ Reference)

Avoid What is Strong

Suppose we are given a language $\mathcal{L}$ and a word w .

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Example 1.5:

- The Halting Problem of Turing machines
- The Entscheidungsproblem (Is a first-order logical statement true?)
- Finding the lowest air fare between two cities ($\rightarrow$ Reference)
- Deciding syntactic validity of C++ programs ($\rightarrow$ Reference)

Avoid: We will focus mostly on decidable problems in this course.

Time and Space

Difficulty

Measuring running time and memory requirements depends highly on the **machine**, and not so much on the **problem**.

Time and Space

Difficulty

Measuring running time and memory requirements depends highly on the **machine**, and not so much on the **problem**.

Resort

Measure time and space only **asymptotically** using **Big- O -Notation**:

Time and Space

Difficulty

Measuring running time and memory requirements depends highly on the **machine**, and not so much on the **problem**.

Resort

Measure time and space only **asymptotically** using **Big-O**-Notation:

$$f(n) = O(g(n)) \iff f(n) \text{ "asymptotically bounded by" } g(n)$$

Time and Space

Difficulty

Measuring running time and memory requirements depends highly on the **machine**, and not so much on the **problem**.

Resort

Measure time and space only **asymptotically** using **Big-O**-Notation:

$$f(n) = O(g(n)) \iff f(n) \text{ “asymptotically bounded by” } g(n)$$

More formally:

$$f(n) = O(g(n)) \iff \exists c > 0 \exists n_0 \in \mathbb{N} \forall n > n_0: f(n) \leq c \cdot g(n).$$

Big- $\mathcal{O}$ -Notation: Example

$$100n^3 + 1729n = \mathcal{O}(n^4):$$

Big- $\mathcal{O}$ -Notation: Example

$$100n^3 + 1729n = \mathcal{O}(n^4):$$

Big- $\mathcal{O}$ -Notation: Example

$$100n^3 + 1729n = \mathcal{O}(n^4):$$

Big- $\mathcal{O}$ -Notation: Example

$$100n^3 + 1729n = \mathcal{O}(n^4):$$

Complexity of Problems

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Complexity of Problems

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult . . .

Complexity of Problems

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult . . .

Example 1.6 (Travelling Salesman Problem): Given a weighted graph, find the shortest simple path visiting every node.

Complexity of Problems

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult . . .

Example 1.6 (Travelling Salesman Problem): Given a weighted graph, find the shortest simple path visiting every node.

- Best known algorithm runs in time $O(n^2 2^n)$
(Bellman-Held-Karp algorithm)

Complexity of Problems

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult . . .

Example 1.6 (Travelling Salesman Problem): Given a weighted graph, find the shortest simple path visiting every node.

- Best known algorithm runs in time $O(n^2 2^n)$
(Bellman-Held-Karp algorithm)
- Best known lower bound is $O(n \log n)$

Complexity of Problems

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult . . .

Example 1.6 (Travelling Salesman Problem): Given a weighted graph, find the shortest simple path visiting every node.

- Best known algorithm runs in time $O(n^2 2^n)$ (Bellman-Held-Karp algorithm)
- Best known lower bound is $O(n \log n)$
- Exact complexity of TSP **unknown**

Even more abstraction

Approach

Divide decision problems into the “quality” of their fastest algorithms:

Even more abstraction

Approach

Divide decision problems into the “quality” of their fastest algorithms:

- P is the class of problems **solvable in polynomial time**

Even more abstraction

Approach

Divide decision problems into the “quality” of their fastest algorithms:

- P is the class of problems **solvable in polynomial time**
- PSpace is the class of problems **solvable in polynomial space**

Even more abstraction

Approach

Divide decision problems into the “quality” of their fastest algorithms:

- NL is the class of problems **verifiable in logarithmic space**

And **many** more!

$\oplus P$, $\#P$, AC, AC^0 , ACC0, AM, AP, APSPACE, BPL, BPP, BQP, coNP, E, FP, IP, MA, MIP, NC, NExpTime, P/poly, PH, PP, RL, RP, Σ_i^P , TISP($T(n)$, $S(n)$), ZPP, ...

Strike at What is Weak

Approach (cf. Cobham–Edmonds Thesis)

The problems in P are “tractable” or “efficiently solvable”
(and those outside are not)

Strike at What is Weak

Approach (cf. Cobham–Edmonds Thesis)

The problems in P are “tractable” or “efficiently solvable”
(and those outside are not)

Example 1.7: The following problems are in P :

- Shortest Path Problem
- Satisfiability of Horn-Formulas
- Linear Programming
- Primality

Strike at What is Weak

Approach (cf. Cobham–Edmonds Thesis)

The problems in P are “tractable” or “efficiently solvable”
(and those outside are not)

Example 1.7: The following problems are in P :

- Shortest Path Problem
- Satisfiability of Horn-Formulas
- Linear Programming
- Primality

Note

The Cobham-Edmonds-Thesis is only a **rule of thumb**: there are (practically) tractable problems outside of P , and (practically) intractable problems in P .

Friend or Foe?

Caveat

It is not known how big P is.

In particular, it is unknown whether $P \neq NP$ or not.

Friend or Foe?

Caveat

It is not known how big P is.

In particular, it is unknown whether $P \neq NP$ or not.

Approach

Try to find out which problems in a class are at least as hard as others.

Friend or Foe?

Caveat

It is not known how big P is.

In particular, it is unknown whether $P \neq NP$ or not.

Approach

Try to find out which problems in a class are at least as hard as others.

Complete problems are then the hardest problems of a class.

Friend or Foe?

Caveat

It is not known how big P is.

In particular, it is unknown whether $P \neq NP$ or not.

Approach

Try to find out which problems in a class are at least as hard as others.

Complete problems are then the hardest problems of a class.

Example 1.8: Satisfiability of propositional formulas is **NP-complete**: if we can efficiently decide whether a propositional formula is satisfiable, we can solve **any** problem in NP efficiently.

Friend or Foe?

Caveat

It is not known how big P is.

In particular, it is unknown whether $P \neq NP$ or not.

Approach

Try to find out which problems in a class are at least as hard as others.

Complete problems are then the hardest problems of a class.

Example 1.8: Satisfiability of propositional formulas is **NP-complete**: if we can efficiently decide whether a propositional formula is satisfiable, we can solve **any** problem in NP efficiently.

But: we still do not know whether we can or cannot solve satisfiability efficiently. We only know it will be difficult to find out . . .

Learning Goals

- Get an overview over the foundations of Complexity Theory
- Gain insights into advanced techniques and results in Complexity Theory
- Understand what it means to “compute” something, and what the strengths and limits of different computing approaches are
- Get a feeling of how hard certain problems are, and where this hardness comes from
- Appreciate how very little we actually know about the computational complexity of many problems

Lecture Outline (1)

- **Turing Machines** (Revision)

Definition of Turing Machines; Variants; Computational Equivalence; Decidability and Recognizability; Enumeration; Oracles

- **Undecidability**

Examples of Undecidable Problems; Mapping Reductions; Rice's Theorem; Recursion Theorem

- **Time Complexity**

Measuring Time Complexity; Many-One Reductions; Cook-Levin Theorem; Time Complexity Classes (P, NP, ExpTime); NP-completeness; pseudo-NP-complete problems

- **Space Complexity**

Space Complexity Classes (PSpace, L, NL); Savitch's Theorem; PSpace-completeness; NL-completeness; $NL = coNL$

Lecture Outline (2)

- **Diagonalisation**

Hierarchy Theorems (det. Time, non-det. Time, Space); Gap Theorem; Ladner's Theorem; Relativisation; Baker-Gill-Solovay Theorem

- **Alternation**

Alternating Turing Machines; $\text{APTime} = \text{PSpace}$; $\text{APSpace} = \text{ExpTime}$; Polynomial Hierarchy

- **Circuit Complexity**

Boolean circuits; alternative proof of Cook-Levin Theorem; parallel computation (NC); P-completeness; P/poly; (Karp-Lipton Theorem, Meyer's Theorem)

- **Probabilistic Computation**

Randomised complexity classes (RP, PP, BPP, ZPP); Sipser-Gács-Lautemann Theorem

- **Quantum Computing**

Quantum mechanics for computer scientists, entanglement, quantum circuits, BQP

- **Interactive Proofs**

Prover and verifier; deterministic proof systems; probabilistic verifiers; the class IP

Looking for Project or Thesis Topics?

On **Thursday, 16 Oct 2025 at 2.50pm in APB 3027** we will present possible topics to conduct in the **Knowledge-Based Systems** group as a **study project** (many suitable modules) or **final thesis** (BSc, MSc, Diploma).

Not only **theoretical topics** but also **implementation work**.

We also have student **job opportunities (SHK/WHK)**.

You are especially welcome if you are eager to work with **Rust** or **LEAN** :)
